Appendix A: Survey Instrument Summary

Executive Summary

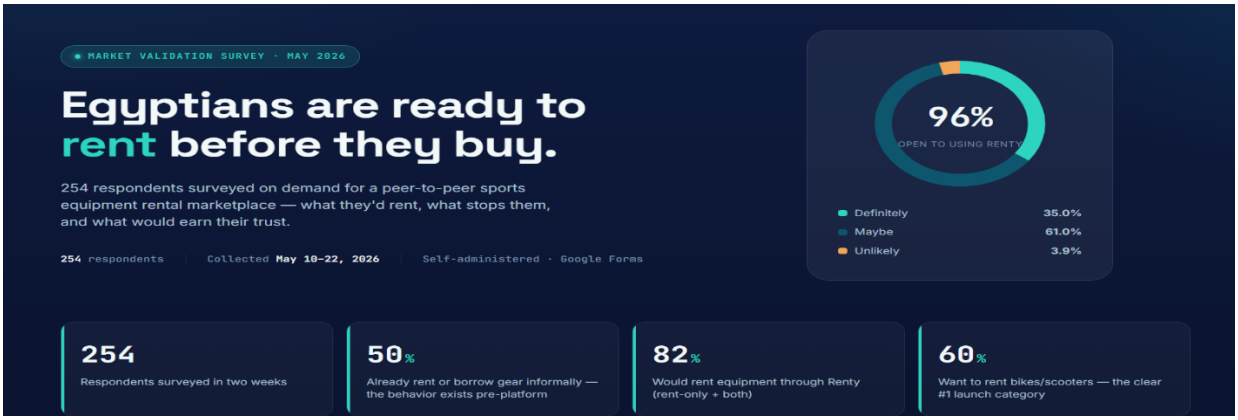

Renty is a proposed peer-to-peer (P2P) rental marketplace for sports equipment, allowing individuals to rent gear directly from other individuals rather than purchasing it outright or relying on traditional retail. This report documents a 254-respondent market validation survey conducted between May 10–22, 2026, and is structured around the questions a graduation project committee would reasonably ask of this work each answered directly from the collected data rather than assumption.

The headline findings are consistent across multiple, independently asked questions: demand to rent is strong, supply exists in parallel, and the dominant barrier is trust rather than interest.

Metric	Value	Source
Respondents surveyed	254	Full sample
Open to using a P2P rental platform	96.1%	Q10 (Definitely + Maybe)
Already rent/borrow gear informally	49.6%	Q2
Would rent equipment through Renty	82.3%	Q11 (Both + Rent-only)
Would lend their own equipment	55.5%	Q11 (Both + Lend-only)
Top demand category cycling	59.8%	Q3
Cite item damage as top concern	70.9%	Q8
Want ratings/reviews as a trust signal	74.0%	Q5
Won't travel more than 15 km for pickup	80.7%	Q17

Table 1. Key metrics referenced throughout this report. Full question text in Appendix A.

The data points toward a specific, buildable product rather than a generic marketplace: a verification- and ratings-driven trust layer, launched first in the cycling category, within a density-first rollout radius, targeting Egypt's 18–24 youth segment as an early-adopter wedge. Sections 1 through 6 develop this argument question by question; Section 7 addresses this study's limitations directly, and Section 8 closes with recommendations.

1. Problem and Market Context

Q: *What problem does Renty solve, and why does it matter now?*

Owning sports equipment is frequently a poor match for how it is actually used. Over half of respondents (53.1%) said they would rent gear because they only need it for a single trip or season, not ongoing use; another 45.7% cited cost savings on expensive equipment, and 22.4% pointed to storage as a burden bulky items like bikes or camping gear are difficult to keep in typical Cairo apartments. These are not abstract concerns; they describe a recurring mismatch between the cost of ownership and the frequency of use, which is the precise condition a rental market is built to resolve.

Q: *Why is this gap currently unmet in Egypt?*

No comprehensive, trustworthy P2P channel for sports equipment exists in the Egyptian market today. Existing options are informal borrowing through personal networks, ad-hoc Facebook groups, or one-off classifieds none of which offer verification, standardized pricing, deposit protection, or recourse if a transaction goes wrong. The survey data reflects this gap directly: 50.4% of respondents have never rented or borrowed sports equipment before, despite 96.1% saying they would be open to doing so on a trusted platform. The absence of trust infrastructure, not absence of interest, is the explanation for that gap a theme this report returns to in Section 4.

2. Research Methodology

Q: *How was the data collected?*

A structured questionnaire was distributed as a Google Form between May 10 and May 22, 2026, covering demand intent, category preference, trust requirements, pricing sensitivity, and logistics preferences. Responses were collected on a rolling basis (254 total), with response volume concentrated around two distribution pushes (May 13 and May 15), consistent with a digitally-shared, snowball-style distribution pattern typical of an early-stage validation survey rather than a probability-sampled study.

Q: *Who responded, and what are the sample's limitations?*

The sample skews heavily toward respondents aged 18–24 (93.3%), with smaller shares aged 25–34 (4.3%) and under 18 (2.4%). This is an important constraint: the findings in this report should be read as validation within a youth, early-adopter cohort a reasonable and intentional wedge market for an initial launch rather than as demand evidence across Egypt's general population. Section 7 returns to this limitation and what it does and does not allow the project to claim.

3. Market Validation: Demand and Supply

Q: *Is there genuine demand to rent sports equipment?*

Yes, and it is the strongest signal in the dataset. Asked directly whether they would use a trusted rental platform, 35.0% said they definitely would and 61.0% said maybe, against only 3.9% who said it was unlikely a combined 96.1% directional openness. The 61% “maybe” share should not be read as weak interest so much as conditional interest: Section 4 shows precisely which conditions would convert it.

Q: *Will people actually supply (lend) their own equipment, or is this a rent-only market?*

The data supports a genuine two-sided marketplace. When asked which role they would personally take, 45.7% said they would both rent and lend, 36.6% would rent only, 9.8% would lend only, and 7.9% said neither. Combining the lending segments, 55.5% of respondents are willing to put their own equipment on the platform meaning supply is not the constraint at launch. This matters for a graduation project defense specifically because it answers the question committees most often raise about P2P models: “where does the initial inventory come from?” Here, the answer is that the demand-side respondents are largely the same people who would supply it.

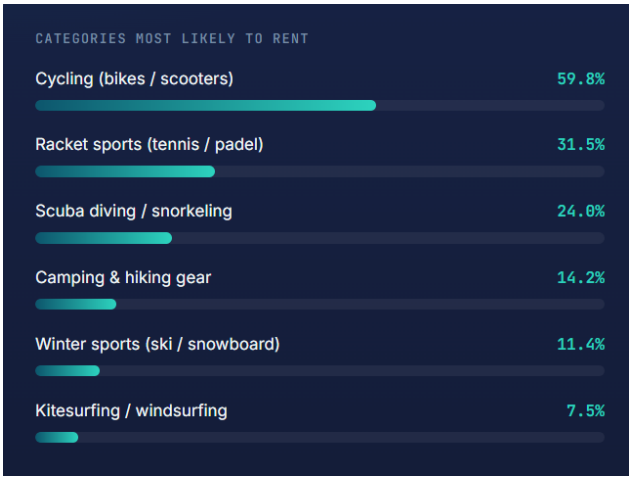

Q: *Which category should Renty launch with first, and why?*

Category	Interested respondents
Cycling (bikes / scooters)	59.8%
Racket sports (tennis / padel)	31.5%
Scuba diving / snorkeling	24.0%
Camping and hiking gear	14.2%
Winter sports (ski / snowboard)	11.4%
Kitesurfing / windsurfing	7.5%

Table 2. Category interest (multi-select; percentages sum to more than 100%). Source: Q3.

Cycling leads by close to a 2x margin over the next-highest category and is the only category with majority interest, making it the clearest candidate for a focused launch vertical rather than an all-categories-at-once approach. Concentrating early operations inventory recruitment, verification process design, logistics on one category before expanding is also the more defensible scope for a graduation project's implementation phase.

4. The Trust Problem

Q: *What is actually stopping people from renting from a stranger?*

Four separate questions converge on the same answer. Asked what concerns them most when renting from a stranger, 70.9% cited item damage during use, 57.5% cited poor or unsafe equipment quality, 44.5% cited hidden fees, and 21.3% cited payment security. These are not diffuse anxieties; they are specific, addressable failure modes in a transaction which is the relevant distinction for product design, since each maps to a concrete mitigation rather than requiring a vague “trust-building” feature set.

Q: *Does the data point to a specific, buildable solution or just a list of complaints?*

It points to a specific solution. When asked what would build their trust in a P2P platform, 74.0% selected user ratings and reviews, 43.7% a secure payment system, 37.4% expert verification of item condition, 35.8% ID verification, and 33.9% deposit protection. Separately, 67.7% said expert verification would increase their trust in rented gear, and 72.8% said they would feel safer if high-end equipment were checked by an expert before or after rental.

The connection between these numbers is the central finding of this report: the same respondents worried about damage (70.9%) and quality (57.5%) are substantially the same respondents who say an expert check would make them feel safer (72.8%) and would increase their trust (67.7%). The problem and the solution were measured independently in the survey instrument and arrived at the same conclusion expert verification paired with a ratings system is not a speculative feature, it is the mechanism this specific market has asked for.

One additional data point supports a related feature: 65.0% said personalized recommendations matched to skill level and location would help them find the right gear faster, suggesting that beyond trust in the transaction itself, a degree of guided matching also reduces friction for first-time renters.

5. Pricing, Deposits and Logistics

Q: *What pricing and deposit structure would the market accept?*

Among the four factors tested, price/affordability had the highest combined “important” or “very important” rating (74.4%), followed closely by flexibility of rental duration (67.3%), proximity of the rental location (70.5%), and availability of specific sizes or models (66.1%) all four matter, but price-sensitivity is marginally the strongest single lever.

On deposits specifically, respondents were asked what security deposit (as a percentage of item value) would make them comfortable lending their own equipment. The most common response was 26–50% of item value (33.5%), followed by 11–25% (26.0%) and 5–10% (21.3%); only 5.9% said they would lend with no deposit at all, relying purely on platform or insurance protection. This indicates that a meaningful deposit mechanism not a token gesture is expected by lenders, and should be built into the transaction flow rather than treated as optional. Separately, respondents rated the value of integrated rental insurance at an average of 3.7 out of 5, with 28.7% rating it a 5 (extremely valuable), suggesting insurance is a genuine purchase driver for a meaningful minority rather than a universal requirement.

Q: *What logistics model fits user expectations for pickup and drop-off?*

Preferences split close to evenly between direct meet-up with the lender (37.4%) and platform-arranged delivery (35.8%), with locker/secure drop-off points favored by 21.3% and designated locations (e.g., a gym or hotel) by 5.5%. This suggests the logistics model should support both a peer-to-peer handoff and a delivery option from the start, rather than committing to a single model. On distance, 80.7% of respondents would not travel more than 15 km to pick up equipment (47.6% capped at 5 km, a further 33.1% at 6–15 km) a strong argument for a density-first launch within a small number of Cairo/Giza neighborhoods rather than a city-wide or national rollout.

6. Business Model Implications

Q: *How does this translate into a viable, monetizable model?*

The data supports a transaction-fee-based marketplace model, structured around three validated revenue-adjacent mechanisms: a commission on completed rentals (justified by the 82.3% who would rent through the platform), an optional insurance product (justified by the 3.7/5 average value placed on it, with 53.5% rating it 4 or 5), and a deposit-holding mechanism that doubles as a trust signal for lenders (justified by the 94.1% of respondents who expect a non-zero deposit). None of these require speculative assumptions about willingness to pay each is grounded in a direct survey response.

Q: *Who is the realistic target user at launch, and is that segment large enough to start with?*

The validated launch segment is Egyptian 18–24-year-olds in dense urban areas (principally Cairo/Giza, based on the 15 km logistics ceiling), with cycling as the entry category. This is a deliberately narrow starting point appropriate for a first release rather than the platform's ceiling. The broader addressable market (older age brackets, other categories, other governorates) is unvalidated by this survey and should be treated as a Phase 2 expansion question, not a launch assumption.

7. Risks and Limitations

Q: *What are the biggest risks to this business model?*

- Trust mechanism execution risk: the survey validates that respondents want expert verification, but does not test whether Renty can deliver it operationally at acceptable cost and speed this is an implementation risk, not a demand risk.
- Two-sided marketplace cold-start risk: 55.5% say they would lend, but stated intent in a survey typically overstates realized behavior; early supply will likely require manual recruitment rather than organic listing.
- Category concentration risk: an initial single-category launch (cycling) reduces scope risk but also means early revenue and engagement are dependent on one vertical performing as the data suggests.
- Deposit/insurance friction risk: while most respondents expect a deposit, the exact percentage and insurance pricing that converts intent into completed transactions has not been tested at a real price point only as a hypothetical preference.

Q: *How should the committee weigh the sample's bias toward 18–24-year-olds?*

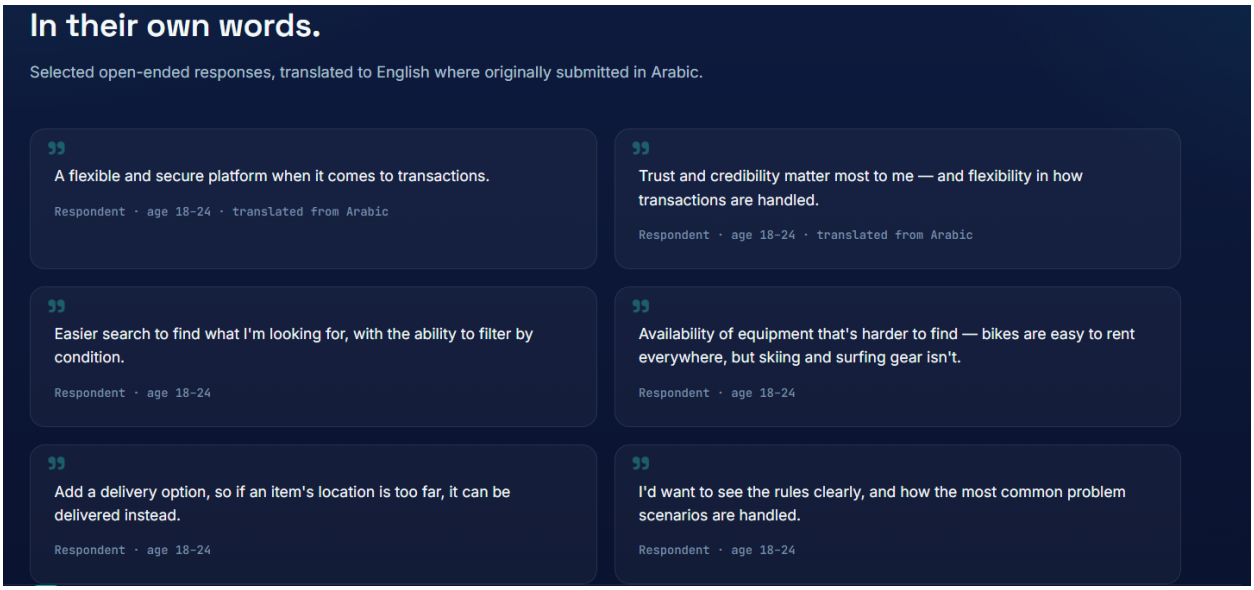

This limitation should be read as a scope statement, not a flaw in the research design. The survey was not intended to estimate population-wide demand; it was intended to validate whether a specific, addressable launch segment shows sufficient demand and trust-conditions to justify building a pilot. For that narrower and more appropriate question, a sample concentrated in the target launch demographic is methodologically reasonable. The limitation becomes relevant only if the findings are extrapolated beyond that segment, which this report deliberately avoids doing.

A secondary limitation is that all multi-select questions (categories, trust factors, reasons to rent, concerns) report percentage of respondents selecting each option, and therefore sum to more than 100% by design this is noted wherever such data is presented to avoid misreading. Finally, the open-text responses quoted in this report's companion dashboard were translated from Arabic to English; translation may introduce minor shifts in emphasis, though not in the substance of the concerns raised.

8. Conclusion and Recommendations

This survey was designed to answer one question before any product is built: is there a real, specific, addressable demand for peer-to-peer sports equipment rental in Egypt, and if so, what would it take to earn the market's trust? The data answers both parts clearly. Demand exists and is concentrated (96.1% openness, led by cycling at 59.8%). Supply exists in parallel (55.5% willing to lend). And the primary barrier trust has a specific, validated solution: expert verification combined with a ratings and review system, reinforced by a meaningful security deposit.

Based on these findings, the recommended next step is a narrow, density-first pilot: a single-category (cycling) launch within a small number of Cairo/Giza neighborhoods, built around a verification and ratings system from day one rather than added later, with both meet-up and delivery logistics supported and a deposit mechanism in the 11–50% range. This scope is deliberately conservative relative to the platform's long-term ambition, but it is the scope this dataset actually supports defending.

Appendix A: Survey Instrument Summary

The table below summarizes every question referenced in this report, in order, for quick reference during discussion.

#	Question	Key result
Q1	Age group	93.3% are 18–24
Q2	Prior rental/borrowing experience	49.6% have rented/borrowed before
Q3	Categories most likely to rent	Cycling leads at 59.8%
Q4	Why rent instead of buy	53.1% cite one-time/seasonal use
Q5	What builds trust in a P2P platform	74.0% want ratings/reviews
Q6	Would expert verification increase trust	67.7% yes
Q7	Would an expert check feel safer	72.8% yes
Q8	Top concern renting from a stranger	70.9% cite item damage
Q9	Would personalized recommendations help	65.0% yes
Q10	Would you use a trusted rental platform	96.1% definitely/maybe
Q11	Which role would you personally use	45.7% would both rent and lend
Q13	Importance of price/proximity/availability/flexibility	Price rated highest overall
Q14	Comfortable security deposit (% of value)	33.5% prefer 26–50%
Q15	Value of integrated rental insurance (1–5)	Average 3.7 / 5
Q16	Preferred pickup/drop-off method	37.4% prefer direct meet-up
Q17	Max distance willing to travel	80.7% within 15 km

Table 3. Full survey reference. A companion interactive dashboard with category-level visualizations and translated open-text responses accompanies this report.
